

F-Secure Anti-Virus for Servers

Comprehensive and centrally managed solution for servers that keeps corporate networks protected.

Today's challenges

An ever-increasing number of new viruses is found each day, some of which can spread globally within hours. Fighting a virus in a corporate network can be costly and time-consuming due to network disruptions, decreased productivity, corrupted data, and the leaking of confidential data. Even a company's reputation can be in danger if it unwittingly spreads viruses to its business associates.

The solution

F-Secure® Anti-Virus™ for Servers ensures that users who connect to corporate file servers with infected machines do not spread viruses on the network. With F-Secure, antivirus protection is fast, efficient and simple, - now with up to 70% less system impact on servers.* Antivirus installations and management can be performed remotely from a single central location. F-Secure® Anti-Virus™ for Servers is available for Windows, Linux and Citrix servers.

Comprehensive protection

F-Secure® Anti-Virus™ for Servers stops all types of malware, including Windows and Linux viruses and macro viruses that infect Microsoft Office files, as well as riskware and spyware. The F-Secure Blacklight™ technology provides detection and removal of hidden malware and suspicious items.

Automatic updates of virus signatures and the scanning platform

The fast and carefree maintainability of the Virus & Spyware protection scanning architecture enables a quick response to the constantly evolving threats. Updating virus definition databases is automatic and secure.

Centralized management, reporting and alerting

The software can be remotely installed, configured and monitored from one central location.

Key features

Real-time protection against viruses, spyware and riskware

Manual scanning for viruses, spyware, riskware and rootkits.

Scheduled scanning

Automatic signature updates (Internet connection required)

Central management from a single console or a new web based interface for local and remote management

Host Intrusion Prevention and Detection

Prevents hackers from entering the network, changing important files, making unauthorized system modifications or saving unwanted files on corporate servers.

Firewall

The integrated firewall makes sure that viruses, hackers and other intruders cannot enter the servers.

Real-time anti-virus scanning

Real-time scanning ensures that users who connect to corporate file servers with infected machines cannot save any infected material on the servers. Administrators can specify and schedule on-demand scans or set parameters for real-time scanning.

Centralized management

The F-Secure Policy Manager™ centralized management system automatically notifies administrators of any security incidents or virus activity. Administrators can easily change and enforce security policies.

New web based user interface

The product can be managed locally and remotely with a new web based user interface. When F-Secure® Anti-Virus™ for Windows Servers and F-Secure® Anti-Virus™ for Microsoft Exchange are installed on the same server, both products can be managed from a single web UI.

Firewall management

The product provides robust monitoring and filtering of Internet traffic, preventing unauthorized access to the servers over the network.
